

Interview Outfit		Daily Attire	
Image	Description	Description	Image
	Ties make the overall outfit appear more professional while also adding a primary color to the rest of the colorless, desaturated, attire.	A casual yet still slightly formal suit such as this one is very fitting for the professional work environment of a software developer.	
	A suit looks professional and formal, which is vital to one's appearance in an interview.	During the daily workflow of a software developer, one must be professional whilst also comfortable in their clothing. A shirt is a great balance of both, since software development does not require much movement.	
	For an interview outfit, comfort is not a requirement, and as a result, dress pants are able to be worn to interviews in order to seem more professional and formal. One can sacrifice comfort for professionalism during an interview.	Although software development is a career that requires little movement, one should still be comfortable in their everyday attire. These jeans are a great example of a good balance of professionalism and comfort.	
	The field of software development is very formal and does not require any physical work, therefore developers should wear dress shoes to an interview.	Software development involves almost no movement at all, therefore dress shoes can be worn on a daily basis, and one does not need to worry about the potential harm their clothing could cause to their movement or maneuverability. However, everyday dress shoes should still be slightly more comfortable than ones worn to an interview.
